**Note:**

(1) PC13, PC14 and PC15 are powered through the power switch. Since the switch only sinks limited current (3mA), the use of GPIO from PC13 to PC15 in output mode is limited:

- ① The speed shall not exceed 2MHz when the heavy load is 30pF;
- ② Not used for current source (e.g. driving LED).

- Startup from main memory
- Startup from BootLoader
- Startup from built-in SRAM

The user can use serial interface to reprogram the user Flash if starting up from BootLoader.

## 4.2 Core

The core of APM32F405xG 407xExG is Arm® Cortex®-M4F with FPU computing unit. Based on this platform, the development cost is low and the power consumption is low. It can provide excellent computing performance and advanced system interrupt response, and is compatible with all Arm tools and software.

## 4.3 Interrupt controller

It embeds a nested vectored interrupt controller (NVIC) that can handle up to 85 maskable interrupt channels (not including 16 interrupt lines of Cortex<sup>®</sup>-M4F) and 16 priority levels. The interrupt vector entry address can be directly transmitted to the core, so that the interrupt response processing with low delay can give priority to the late higher priority interrupt.

### 4.3.2 External Interrupt/Event Controller (EINT)

The external interrupt/event controller consists of 23 edge detectors, and each detector includes edge detection circuit and interrupt/event request generation circuit; each detector can be configured as rising edge trigger, falling edge trigger or both and can be masked independently. Up to 140 GPIOs can be connected to 16 external interrupt lines.

## 4.5 **Clock**

### 4.5.1 **Clock tree**

Clock tree of APM32F405xG 407xExG is shown in the figure below:

Figure 7 APM32F405xG 407xExG Clock Tree

## 4.5.2 Clock source

Clock source is divided into high-speed clock and low-speed clock according to the speed; the high-speed clock includes HSICLK and HSECLK, and the low-speed clock includes LSECLK and LSICLK; besides, some modules may have additional clock source pins to obtain the required clock frequency through external circuits.

## 4.5.3 System clock

HSICLK, PLLCLK and HSECLK can be selected as system clock; the clock source of PLLCLK can be HSICLK or HSECLK; the required system clock can be obtained by configuring PLL clock multiplier factor and frequency division factor.

When the product is reset and started, HSICLK is selected as the system clock by default, and then the user can choose one of the above clock sources as the system clock. When HSECLK failure is detected, the system will automatically switch to the HSICLK, and if an interrupt is enabled, the software can receive the related interrupt.

## 4.5.4 Bus clock

AHB, APB1 and APB2 buses are built in. The clock source of AHB is SYSCLK, and the clock source of APB1 and APB2 is HCLK; the required clock can be obtained by configuring the frequency division factor. The maximum frequency of AHB is 168MHz, the maximum frequency of APB2 is 84MHz, and the maximum frequency of APB1 is 42MHz.

## 4.5.5 Phase locked loop

APM32F405xG 407xExG series product has two PLL, one is PLL (PLL1), and the other is PLL (PLL2) specially used to provide specific clock frequency for I2S. They all need to generate different clock frequencies by configuring parameters. Please refer to the *User Manual* for specific parameters and configuration registers.

# 4.6 Power and power management

## 4.6.1 Power supply scheme

Table 15 Power Supply Scheme

Name	Voltage range	Description
V <sub>DD</sub>	1.8~3.6V	I/O (see pin distribution diagram for specific IO) and internal voltage regulator are powered through V <sub>DD</sub> pin.
V <sub>DDA</sub> /V <sub>SSA</sub>	1.8~3.6V	Supply power for ADC, DAC, reset module, RC oscillator and PLL analog part; when ADC or DAC is used, V <sub>DDA</sub> and V <sub>SSA</sub> must be connected to V <sub>DD</sub> and V <sub>SS</sub> .
V <sub>BAT</sub>	1.8~3.6V	When V <sub>DD</sub> is disabled, RTC, external 32KHz oscillator and backup register are powered through internal power switch.

## 4.6.2 Voltage regulator

Table 16 Regulator Operating Mode

Name	Description
Master mode (MR)	Used in run mode
Low-power mode (LPR)	Used in stop mode
Power-down mode	Used in standby mode; when the voltage regulator has high-impedance output, the core circuit is powered down, the power consumption of the voltage regulator is zero, and all data of registers and SRAM will be lost.

Note: The voltage regulator is always in working state after reset, and outputs with high impedance in power-down mode.

## 4.6.3 Power supply voltage monitor

Power-on reset (POR), power-down reset (PDR) and brown-out reset circuits are integrated inside the product. These three circuits are always in working condition. When the power-down reset circuit monitors that the power supply voltage is lower than the specified threshold value ( $V_{POR/PDR}$ ), even if the external reset circuit is used, the system will remain reset.

The product has a built-in programmable power supply voltage monitor (PVD) that can monitor  $V_{DD}$  and compare it with  $V_{PVD}$  threshold. When  $V_{DD}$  is outside the  $V_{PVD}$  threshold range and the interrupt is enabled, the MCU can be set to a safe state through the interrupt service program.

## 4.7 Low-power mode

APM32F405xG 407xExG supports three low-power modes, namely, sleep mode, stop mode and standby mode, and there are differences in power, wake-up time and wake-up mode among these three modes. The low-power mode can be selected according to the actual application requirements.

Table 17 Low-power Mode

Mode	Description
Sleep mode	The core stops working, all peripherals are working, and it can be woken up through interrupts/events
Stop mode	Under the condition that SRAM and register data are not lost, the lowest power consumption can be achieved in stop mode; The clock of the internal 1.3V power supply module will stop, HSECLK crystal resonator, HSICLK and PLL will be disabled, and the voltage regulator can be configured in normal mode or low-power mode; Any external interrupt line can wake up MCU, and the external interrupt lines include one of the 16 external interrupt lines, PVD output, RTC and USB_OTG.
Standby mode	The power consumption in this mode is the lowest; Internal voltage regulator is turned off, all 1.3V power supply modules are powered down, HSECLK crystal resonator, and HSICLK clocks are disabled, SRAM and register data disappear, RTC area and backup register contents remain, and the standby circuit still works;

Mode	Description
	The external reset signal on NRST, IWDG reset, rising edge on WKUP pin or RTC event will wake MCU out of standby mode.
